# LONG-ACTING REVERSIBLE CONTRACEPTION

Summary Tables

**Bridging the Divide:**

**A Project of the Jacobs Institute of Women's Health**

June 2016

**Table 1. Summary of LARC Methods**

	Available Since	Years Effective	Use	Possible Side Effects	Dosage
<b>Copper IUD</b>					
ParaGard	1988	10 years	Approved only in parous women, but available to all women regardless of parity.*  Can be used as emergency contraception.	Abnormal menstrual bleeding. Higher frequency or intensity of cramps/pain.	n/a
<b>Hormonal IUDs</b>					
Mirena	2001	5 years	Approved only in parous women, but available to all women regardless of parity.*	Inter-menstrual spotting in the early months. Reduces menstrual blood loss significantly. Hormone-related: headaches, nausea, breast tenderness, depression, cyst formation.	Initial: 20 mcg/day Before removal: 10 mcg/day
Skyla	2013	3 years	Approved for women regardless of parity.		Initial: 14 mcg/day Before removal: 5-6 mcg/day
Liletta	2015	3 years	Approved for women regardless of parity.		Initial: 18.6 mcg/day Before removal: 12.6 mcg/day
<b>Implants</b>					
Nexplanon	2011	3 years	Approved for women regardless of parity.	Inter-menstrual spotting in the early months. Hormone-related: headaches, nausea, breast tenderness, depression, cyst formation.	Initial:60-70 mcg/day Before removal: 25-30 mcg/day

\*In 2005, the package label for the ParaGard IUD changed. The new label no longer contains language that suggests the IUD is appropriate only for women with one or more children. However, the Mirena label has not yet undergone a similar change (American College of Obstetricians and Gynecologists, 2011).

**Table 4. CDC Guidance for LARC Follow-Up Care**

	<b>Copper IUD</b>	<b>Hormonal IUDs</b>	<b>Implant</b>
<b>Routine Follow-Up</b>	No routine follow-up visit required	No routine follow-up visit required	No routine follow-up visit required
<b>Bleeding Irregularities</b>	Unscheduled spotting or light bleeding, as well as heavy or prolonged bleeding, are common and generally not harmful, and decrease with continued use.	Unscheduled spotting, light bleeding, or amenorrhea are common and generally not harmful, and decrease with continued use.	Unscheduled spotting, light bleeding, or amenorrhea are common and generally not harmful, and might or might not decrease with continued use.
<b>PID</b>	Does not need to be removed immediately if the woman needs ongoing contraception.  If no clinical improvement occurs 48-72 hours after treatment, continue antibiotics and consider removal of the IUD.	Does not need to be removed immediately if the woman needs ongoing contraception.  If no clinical improvement occurs 48-72 hours after treatment, continue antibiotics and consider removal of the IUD.	N/A
<b>Pregnancy</b>	Provider should advise the woman that she has an increased risk for spontaneous abortion, septic abortion, and preterm delivery if the IUD is left in place. Provider should also evaluate for possible ectopic pregnancy.	Provider should advise the woman that she has an increased risk for spontaneous abortion, septic abortion, and preterm delivery if the IUD is left in place. Provider should also evaluate for possible ectopic pregnancy.	N/A*

\* There are few documented risks to the woman or the fetus if the implant is left in place; there is no evidence that the risks associated with the hormones in implants are different from those of combination oral contraceptives. Providers may counsel patients to have the implant removed, (Bayer HealthCare Pharmaceuticals 2013).
